“I’m an optimist, always, that the world can be a better place.”

Professor Fred Hollows
It’s 30 years since Professor Fred and Gabi Hollows established The Fred Hollows Foundation. We continue their work of eradicating avoidable blindness with a focus on the Pacific Region, thanks to the generosity of donors like yourself the vision of thousands of people has been improved. There is more to do, and we still need your help. The Future Fund demonstrates how your generous support can make a long-term difference.

During this time, we have begun to build a strong in-country eye care workforce, supporting the training of over 300 eye doctors and nurses, who in turn have saved the sight of thousands of people. None of that would have been possible without your support. Your support alongside key partnerships like Ministry of Foreign Affairs and Trade have contributed over $5 million to provide lasting, sustainable impact for eye care in the Pacific through Future Fund projects. And it means that every year we can continue growing a sustainable local workforce so even more people across the Pacific can access the eye care they so critically need.

The global impact of COVID-19 has unequivocally shown that the health of a nation’s population is central to every part of its social and economic fabric. The ability to see is a cornerstone of a person’s ability to live with dignity and independence. When you give to the Future Fund you enable our teams in the Pacific to invest in the local eye-care workforce and restore sight today, tomorrow and years into the future.

Divine Word University is one of only two universities providing eye care training in Papua New Guinea (PNG). Currently there are only nine double units providing accommodation for 18 students who have travelled from all corners of PNG to complete their qualifications in eye health. As PNG has one of the highest rates of blindness in the world creating sustainable impact requires more eye specialists. Upgrading the dormitory will not only improve the condition of the accommodation for current students but will enable us to turn the nine double units into 16 single units and support more people in PNG to become eye doctors and nurses for their community.

Divine Word University is one of the motivational factors that drove me to take up ophthalmology is to give hope of sight to rural communities. The eye is one of the vital body organs. I have a strong conviction that it was my calling to work in eye care. When COVID-19 arrived in PNG most schools were shut down to avoid close contact and transmission. Even though we were to isolate, we still had class online and that is one of the advantages. Our schedule of lectures was not affected and I completed the academic year successfully despite COVID-19, with the help of The Fred Hollows Foundation NZ. One of the motivational factors that drove me to take up ophthalmology is to give hope of sight to rural communities.

Moses successfully completed his Advanced Diploma in Eye Care from Divine Word University, Madang at the end of last year and has already started seeing patients in the Jiwaka Province which is close to his home province.

Introducing Moses Kombra

“My name is Moses and I come from the Western Highland province of Papua New Guinea. During this time, we have begun to build a strong in-country eye care workforce, supporting the training of over 300 eye doctors and nurses, who in turn have saved the sight of thousands of people. None of that would have been possible without your support. Your support alongside key partnerships like Ministry of Foreign Affairs and Trade have contributed over $5 million to provide lasting, sustainable impact for eye care in the Pacific through Future Fund projects.
It is estimated that at least 2.2 billion people around the world have a vision impairment, of whom at least 1.1 billion have a vision impairment that could have been prevented or is yet to be addressed. Our Pacific neighbours have some of the highest rates of avoidable blindness and the significant environmental challenges on top of a fresh wave of COVID-19 disruption have only seen eye care needs increase.

Our Pacific teams and partners have identified the following outreach support for 2022 to ensure that eye care remains accessible to their local communities.
## GRADUATE PROGRAMME AND HEALTH SYSTEMS SUPPORT

The eye care workforce in the Pacific is still small, stretched and geographically spread. The Foundation continues to support eye care specialists across the Pacific with professional development, equipment and mentorship. With nearly everyone needing eye care at some point in their lives, ongoing support is critical to ensure the growing eye care workforce has the tools it needs to ensure it’s available to those in the Pacific.

The equipment below will be sent directly to eye doctors and nurses in the Pacific, to give them tools to help the growing list of people needing their help.

<table>

“I have been privileged to be given this opportunity by The Foundation to become an Ophthalmologist to serve my people in the Solomons and to do so with the late Fred Hollows’ passion for mankind. To be able to help the people in Solomon Islands means a lot to me on so many levels. I can be a role model to young Solomon Islanders to continue to achieve their personal best, not just for themselves, but to bettering Solomon Islands. On a family level it means that as a wife I can help my husband support our family and as a mother to three girls, show my children that women can do most anything they aim to.”

Dr Carole Poloso, Ophthalmologist, Regional Eye Centre, Solomon Islands
Fred recognised that building a local eye care workforce was the most powerful way to address avoidable blindness and, through 30 years of restoring sight, this is still central to our work today. Our commitment to training local eye doctors and nurses with your support means that urgent and critical eye care can continue in the Pacific despite borders being closed due to COVID-19.

“Online webinars are important because we shared and learned from other experiences that motivate and upskilled our learning. With that this must not be stopped but must be continued for other learners after me and my colleagues.”

Fredrick Silki, Divine Word University Advanced Diploma in Eye Care graduate 2021, Papua New Guinea.

Lensometer
The lensometer is an instrument used to verify the prescription of eyeglasses or spectacles. It is commonly used prior to an eye examination to obtain the last prescription the patient was given, in order to expedite the examination.

Stryker Bed
This operating bed is essential for cataract operations which can be adjusted; up and down and forward and back tilt of patient.

Ultrasonic Bath
Ophthalmic surgery uses very fine-tuned instruments and sometimes material may still remain after standard surgical cleaning. Soundwaves from this machine loosen this material which means nothing remains inside.

Vital signs monitor
The vital signs monitor measures pulse, blood pressure and the amount of oxygen in the blood. This is useful for the operating doctor to know that the patient is healthy and stable during the surgery.

iCare Tonometer
This measures the pressure inside the eye which is regulated by a fluid. The iCare tonometer does not need any anaesthetic and is portable.

Portable Slit Lamp
The portable slit lamp is a smaller version of a table mounted slit lamp. It is helpful if a patient cannot sit behind a table mounted slit lamp or to take on Outreaches.

Ultrasonic Bath
